Orchard Grass

Orchardgrass is valuable on light textured soils due to its outstanding drought-tolerance. Most varieties have good winter-hardiness, although few varieties have superior winter-hardiness. The species is rather slow to establish but persistency is good under hay, silage, and proper grazing management. After it starts growing in the spring, orchardgrass tends to head very quickly. Late heading varieties therefore can provide more flexibility in management options. Late maturing orchardgrass is also popular as a companion grass for alfalfa.

Baraula

Baraula is the latest maturing orchardgrass available from Barenbrug. Its late maturity makes it the orchardgrass of choice to grow with alfalfa. In addition to its late maturity, it is also very winter-hardy and is less clumpy and more leafy than traditional varieties.

Orchardgrass

- Late maturing
- Excellent to grow with Alfalfa
- Very winter-hardy
- High-energy feed
- More leafy
